

## HEAP - II

### (a) Heapsort

n times do heapify.

(a) Given an array which is k sorted.

6, 5, 3, 2, 8, 10, 9

each element is moved at most

k places  $k=3$

• build the min heap of size  $k+1$ .

move the window pop one

and push one.

$O(k) + O(n \lg k)$  (n-k) deletion

$O(k) + (n-k) \lg k$

(b) Given an array  $\rightarrow$  1, 23, 12, 9, 30, 2, 50.

Find 1st k min elements

i) Build max heap  $\rightarrow O(n) + k \lg n$

Optimize

② Build k-sized min heap.

if we encounter greater than top

then replace. otherwise ignore.

Finally we will get k largest

elements.

Intuition  $\rightarrow$  keep track of k elements

and whenever a greater element comes

replace with smallest.

$O(k) + (n-k) \lg k$ .

Online algo  $\rightarrow$  given answer on each input.

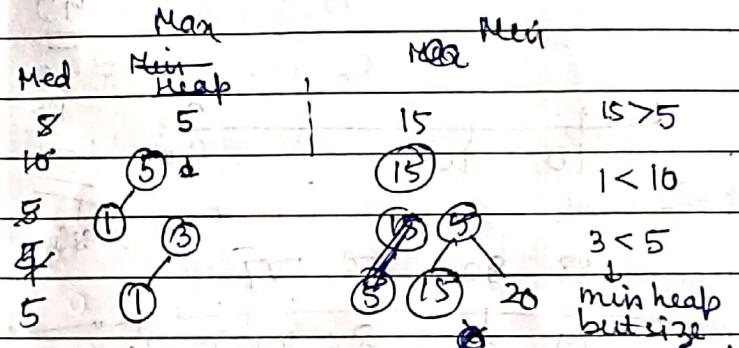

### (a) Median of Running Stream of Integers

Here we are only bothered about middle elements rest all (order of rest are not matter).

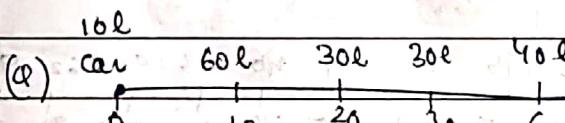

largest of lower part (Max Heap)

smallest of the upper part. (Min Heap)

$$| \text{size of left} - \text{size of right} | \leq 1$$

compare with current median and push to the regd. heap accordingly.

$$\text{Pos} = [10, 20, 30, 60]$$

$$F = [60, 30, 30, 40]$$

1 liter = 1 unit distance.

60 30 30 40

+60 → 50 → 30 →

when because they we can get

the largest among the visited options

min heap

	60	30	30	40	
st=10	0	50	40	10	
sum = 10	10	20	30	60	
					100

## GREEDY

Date \_\_\_\_\_  
Page \_\_\_\_\_

(a)  $k^{th}$  minimum in a sorted matrix.

60	30	30	40	
0	10	20	30	60
.	.	30	60	
.	.	50		
.	.			

10	20	30	40	
15	25	35	45	
24	29	37	48	
32	33	39	50	

$$k=3 \rightarrow 20$$

My approach  $\rightarrow$  go to required row

and the use min heap  
 $k=3 \rightarrow \text{row} = 3$   $x_4$   $\min = 3 \vee 4$ .

suppose  $k=7 \rightarrow \text{row} = 7$   $\min = 7 \vee 4$   
~~X fill row~~

create heap of first row.

and pop  $k$  times whenever

you pop  $\rightarrow$  push the next column element in the heap.

1	2	93	5	49	40	73	91	62	94
A	11	35	59	75	78	120	228	265	281

$O(n) + O(\lg n)$

further modified

st=14	3	11	4	6	8	
Sum	11	35	4	6	8	
12	45	11				

$O(k) + O(k \lg k)$

create the heap by first  $k$  elements of the 1st row then do the above.

Ques

push 10 pop 10  $\rightarrow$  continue

15  $\rightarrow$  pop  $\leftarrow$  push 20, 15

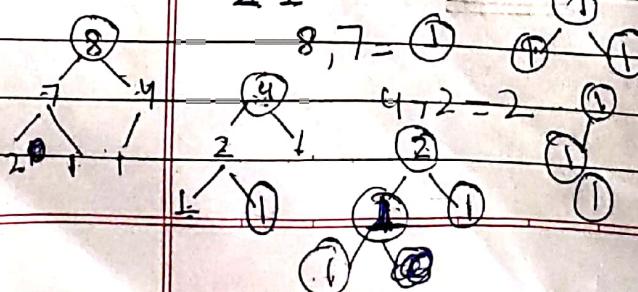

25  $\rightarrow$  15  $\rightarrow$  push 28, 24

20  $\rightarrow$  then pop 20 and push the next column,

more optimal

(-1 -2) -3 0 1 2 (3) P 4 7 8 12

(Q)

given array

 $-2, 0, 5, -1, 2$  $K=4$ 

do K negations

after K ops → maximize sum.

we can negate same element twice.

- My app → min heap → negate top and push back to min heap.
- ↳ k lgn

in O(1) space. but nlgn.  
keep negating and keep track of min element.

↳ keep negating the min element. (if +ve encounter)

(Q) Minimum cost of Ropes

A, B → K min sum pairs.

Min. possible max after K ops.

↳ giving immediate benefit

Greedy approach

↳ if local optimum is global optimum → then worst

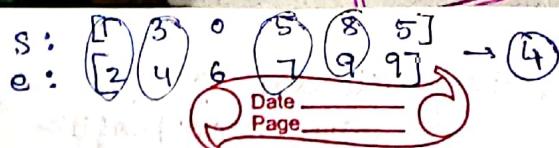

greedy would work.

(Q) Activity Selection

S:  $\boxed{10} \quad 12 \quad \boxed{20}$   
E:  $\boxed{20} \quad 25 \quad \boxed{30}$

at any time  $t \rightarrow$  you can do 1 activity.

find maximum activities you can do.

• Sort according to end times.

and select if cur start  $\geq$  prev end time.

(Q) given an array →

 $-1, -1, -2, 4, 3. = -24$ 

↳ Min subset product.

 $-5, 2, 1 \rightarrow -10$  $-5, 0 \rightarrow -5$  $6, 0, -2 \rightarrow -12$ .

① odd negatives and all +ves.

② count -ve elem

odd ↳ even

multiply  
except 0multiply  
leave the max -ve  
elementelse.  
↳ all positive then

min value

→ most  
frequently  
asked.

(Q) Job Scheduling

n jobs with their deadline and profit

Job	Deadline	Profit
a	4	20
b	1	10
c	1	40
d	1	30

each job can be done in 1 day.  
but before deadline day.

Maximize the profit.

- sort according to pair  $\langle \text{dead}, \text{profit} \rangle$

- sort according to pair  $\langle \text{profit}, \text{dead} \rangle$

fill on the deadline and search for next available.

slot

~~can be optimised using sets~~

$$\mathcal{O}((\text{align} + d^2) \cdot \frac{1}{d})$$

$d$  is no. of day.

for each day you need to search for an empty slot.

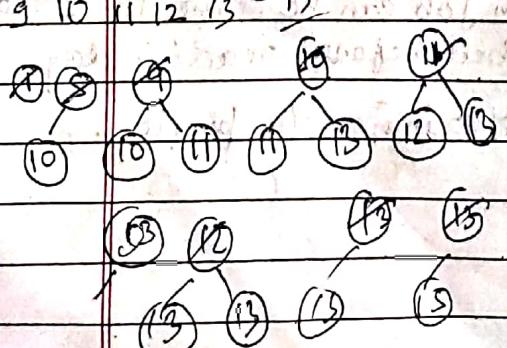

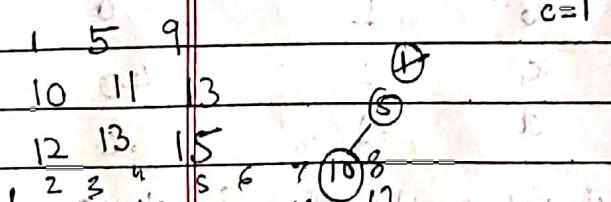

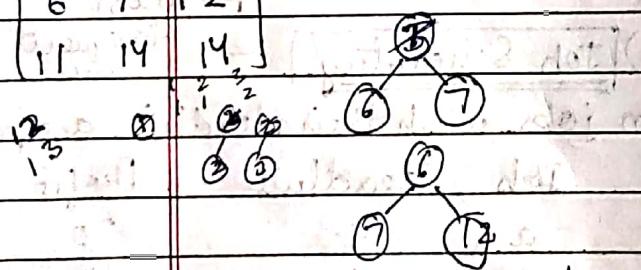

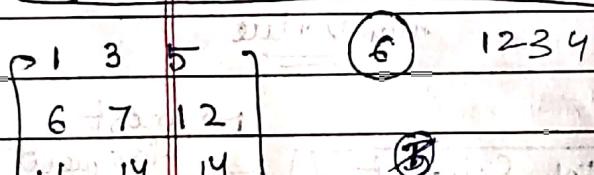

- more optimized  $\rightarrow$  use disjoint

dataset

maxi

sets  $\rightarrow$  maximum value is lesser

than the given value.

## Max Xor Pair in Array

first move left when 0 comes  
move right when 1 comes

so tree node would basically contain  $\leftarrow \text{left}$  and  $\rightarrow \text{right}$ .  
struct trienode {

    trienode \*left, \*right;

};

void insert (int n, root)

\*cur = root

for (int i=31; i>=0; i--)

    b = (n>>i) & 1;

    if (b==0)

        if (!cur->left)

            { cur->left = new trienode(); }

        cur = cur->left

    else

        if (!cur->right)

            { cur->right = new trienode(); }

        cur = cur->right;

How to find max xor

go for given n.

find it's jth bit and try

to transpose to its opposite bit

if exists.

find man (head, a, n)

max-xor = INT\_MIN

for (i=30; i<n; i++)

    if int val = a(i)

        \*cur = head;

    for (j=31; j>=0; j--)

        b = (var>>j) & 1;

$b = -9$

### (a) distribute Cables

1 2 3 2 4  
1 2 3 1 2

1 2 2 3 4 3 2 1  
1 2 1 2 3 1 2

## Charley

N-items Moving

Terminal either to constant or

guard.

• Stability  $\rightarrow S_i$  of terminal

$D_g \rightarrow g_i$  removing cost =  $w_i$

$D_c \rightarrow S_u, S_v$  (of content and)

total cost of removing cables.

N M

$S_i \rightarrow$  States

$w_i \rightarrow$  cost

allow

remove no. of cables

read 0 is new  $S_i = 2$

$1^i \cdot y - w_i = y$

$2 \rightarrow$  no change

↳ Dynamic Programming.

$$1+1+1+1+1+1 = 6$$

$\rightarrow$  because we reuse the prev sum.

(b) Fibonacci → if we use recursion

then we get  $O(2^n)$  → exponential time

so go with dp.

↳ Constructed a Recurrence Relation

Relation

↳ 1. Removing Redundancy.

↳ 2. Redundant calculations without extra tag

↳ 3. Initialization

↳ 4. Recurrence Relation

↳ 5. Time Complexity

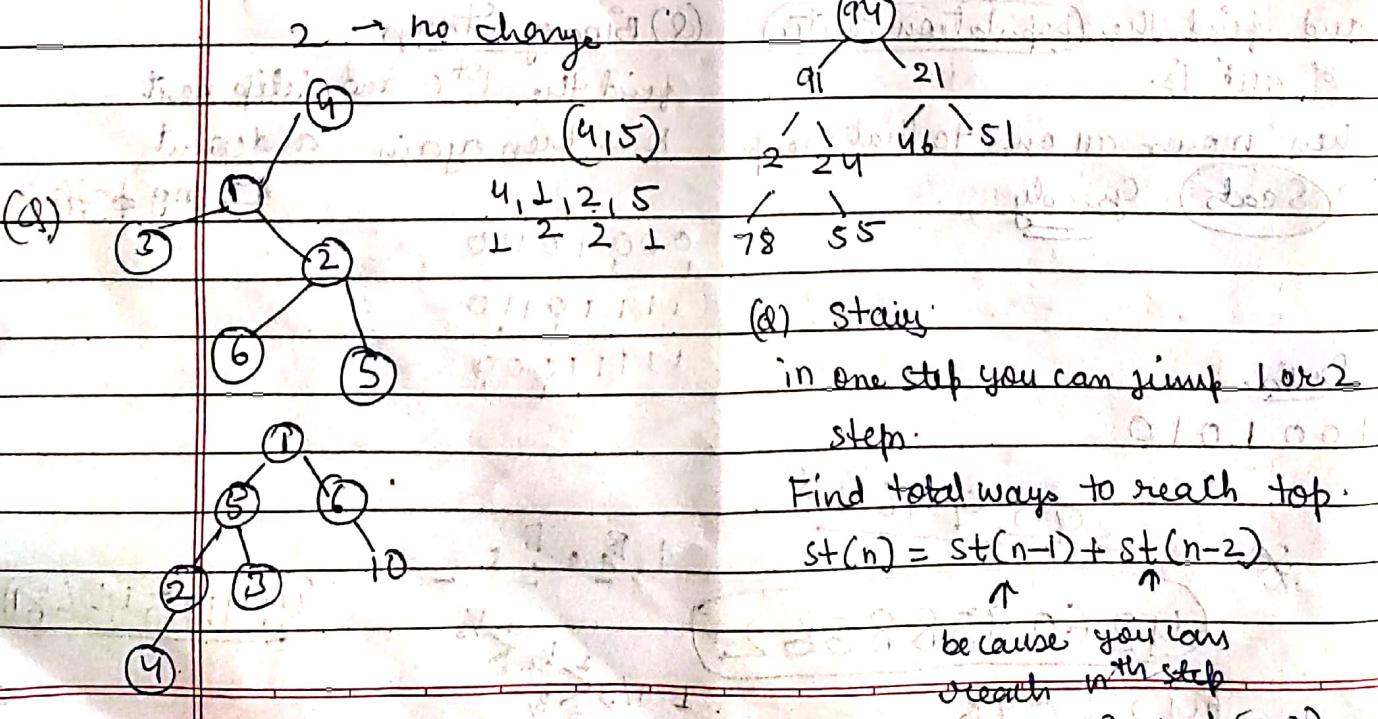

↳ 6. Space Complexity

↳ 7. Optimizations

↳ 8. Applications

↳ 9. Conclusion

↳ 10. Summary

### (d) Stair

in one step you can jump 1 or 2 steps.

Find total ways to reach top.

$$st(n) = st(n-1) + st(n-2)$$

because you can reach with step

from  $n-1$  and  $(n-2)$

### (a) Coin Change Problem →

$$n \text{ coins} = [5, 10, 25]$$

$$\text{Sum} = 30$$

Min no. of coins to make the sum.

$$30 = 5 + 25$$

→ taking Max denomination first will not work

$$[9, 6, 5, 1] \rightarrow \text{Sum} = 11$$

$$\hookrightarrow \text{ans} = 2, [6, 5]$$

Greedy approach will fail

↓ we know answer of these.

$$f(30) = \min \left\{ \begin{array}{l} f(25) + f(5) \\ f(20) + f(10) \\ f(5) \end{array} \right\}$$

∴ Solving for all others

now we can see Redundancy

to come up with Recurrence and Remove Redundancy.

int minCoins(int s) {

if (s == 0) return 0;

int cmin = INT\_MAX;

for (i=0; i < M.length(); i++) {

if (M[i] ≤ s)

cmin = min(cmin,

M[i] + minCoins(s - M[i]))

return cmin + 1; } }

↑ to remove recursion

use precalculated values

and if it's present then

return it else push the

new value.

• Try to remove recursion by storing values.

Memoization (Building your cache)

### (b) Tabularization

start from

Small end build your table.

### (c) given n

find min no. of squares to form this n

$$n=3 \rightarrow 1^2 + 1^2 + 1^2 = 3$$

$$n=100 \rightarrow 10^2 = 1$$

$$n=12 \rightarrow 3^2 + 1^2 + 1^2 + 1^2 = 4$$

$$2^2 + 2^2 + 2^2 = 3 \times 4$$

Search from 1 to  $\sqrt{n}$  will

become same as prev.

$$n=12 \rightarrow (1, 2, 3)$$

$$(1, 4, 9) \rightarrow (1, 4, 9)$$

min no. to make 12.

### (d) Own a wine shop

Sell 1 bottle per year.

$$\text{Price} = 60[1, 4, 2, 3]$$

each year  $P(i) = 4 \times A(1)$

increase with year

because older the wine (costly).

only sell bottles which are at

comple

$$[1, 4, 2, 3]$$

$$P = 1 \times 1 + 3 \times 2 + 2 \times 3 + 4 \times 4$$

$$= 1 + 6 + 6 + 16 = 29$$

greedy will fail →

$$E.g. \rightarrow 2, 3, 5, 14$$

$$2 \times 1 + 3 \times 2 + 4 \times 3 + 1 \times 4 + 5 \times 5$$

$$= 2 + 6 + 12 + 4 + 25$$

$$\Rightarrow 49 \times \text{Wrong}$$

$$\text{If } 2 \times 1 + 4 \times 2 + 1 \times 3 + 3 \times 4 + 5 \times 5$$

$$= 2 + 8 + 3 + 12 + 25$$

$$= 50 \times \text{Right}$$

## Revenue Rec

$$P[0-N] = \max [P(0-y) + A(y) \times y, \\ A(y) \times y + P(1-y)]$$

Profit by selling

$$P[0-3] = \max [A(0) \times y, A(1) \times y]$$

$$A(0) \times y + P(1-y)$$

$$A(1) \times y + P(2-y)$$

$$P[0-N] = \max [A(0) \times y, P(1-N),$$

$$P[0-N-1] + A(N-1) \times y]$$

not ID - DP

Int Price [ints, infed] {

    if (e < s) return 0;

    return max(price(s+1, e, y+1) +  
        cache[s][e] = w[s] \* y, price(s, e-1, y+1))

}

↑  
same as the revenue  
relation

How to convert to D.D.

So keep a cache [ ] [ ] .

for price [s+1][e].

↳ check in cache [ ] [ ]

else at the end

on

GRAPHS

$$=$$

data structures in set of  $(V, E)$

$$G([B, C], BC).$$

edge can be bi/uni-directional

edge can be weighted or unweighted.

$N$ -nodes  $\rightarrow$  Max edges  $\rightarrow N^2$

graph can have 0 edges

(disconnected graph)

Connected

Comp

you can reach  
to any node from any  
other node.

Representation

① Adjacency Matrix

A B C

Symmetric

because graph is un-directed

space  $\rightarrow O(N^2)$

A	0	1	0
B	1	0	1
C	0	1	0

② Adjacency List

$$0 = [1]$$

$$1 = [0, 2, 3] \rightarrow \text{more efficient}$$

$$2 = [1, 3]$$

$$3 = [1, 2]$$

↳ vectors & vectors  $>$  0.

• Graph Traversals

void DFS (int i)

```
{ print i;
  vis[i]=true;
  for all j in adj list(i)
```

```
{ if !vis[j]
```

```
{ vis[j]=true;
```

```
DFS[j]; }
```

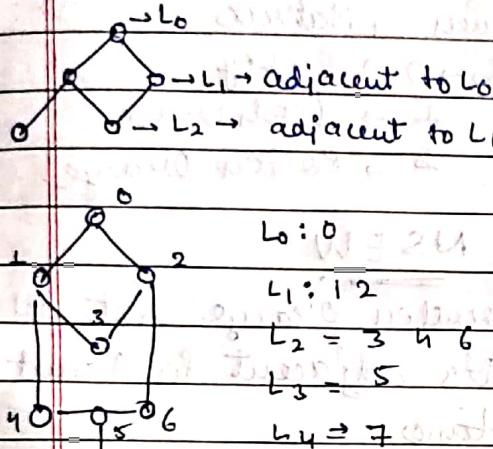

$O(V+E)$  or  $O(\max(V, E))$

Now using stack  $\rightarrow$

(Q) Given an undirected graph.  
check whether it's a connected graph.

• Run DFS once → and after that if any node is not visited means disconnected else connected.

← [BFS Traversal] → it traverses level by level.

do this using a queue  $\rightarrow$  good practice and better visual

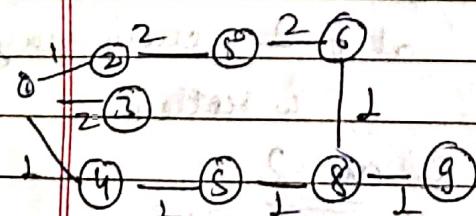

- useful to find shortest distance

in undirected graph.

However, if the graph is weighted with different weights then BFS wouldn't work.

(Q) Given an undirected graph.

$$w = \{1, 2\}.$$

modify BFS by inserting dummy nodes where

$$d=2$$

Remember this  $\rightarrow$  to create dummy nodes to make  $d=1$ . Then simply apply BFS to get the shortest distance.

(Q) Grid Problem  $\rightarrow$  cell  $\rightarrow 0 \rightarrow$  water  $\rightarrow 1 \rightarrow$  cloud

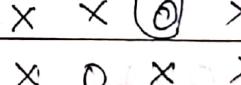

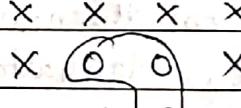

1	1	0	0	0
0	1	0	0	1
1	0	0	1	1
0	0	0	0	0
1	0	1	0	1

Total  
5 islands

just a matter of connected components

(Q) 2D Board.

contains 'X' and 'O'.

if continuous streak of 'O's is surrounded by 'X's from NSEW then those 'O's would be captured.

• Those 'O's will not be captured whose one of the 'O' is at boundary so traverse only on boundary and trigger DFS on those 'O's

(a)

Given  $M \times N$  matrix.

s: source  $\rightarrow$  only 1 occurrence

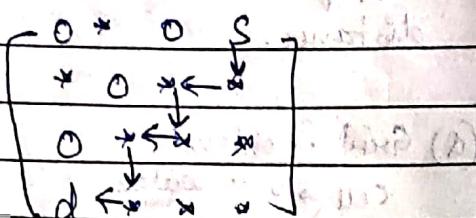

d: dest.  $\rightarrow$  only 1 occurrence.

$\rightarrow$  safe

0 - unsafe.

moves: NSEW

I/P  $\rightarrow$

Insert all 1's in a queue  
and start the BFS.

(Multi Source BFS)

- check if not already visited
- check if it's 0
- check if it's a safe

Find shortest Path from s to d

$$d = \text{here}, d=6$$

just apply a simple BFS

do create isSafe fn

(b) Given a Matrix

cells  $\rightarrow$  0  $\rightarrow$  empty

1  $\rightarrow$  fresh orange

2  $\rightarrow$  rotten orange.

NSEW

A rotten orange rots all  
its adjacent in 1 unit  
time.

Find min Time To rot all  
oranges if possible,  
else set -1.

(c) Given  $N \times M$  Matrix (Boolean).

for every cell  $(i, j)$

find the distance of

cell  $(i, j)$  from the nearest 1.

(Find the Manhattan dist.)

I/P  $\rightarrow$

0	0	0	1
0	0	1	1
0	1	1	0

3	2	1	0
2	1	0	0

1	0	0	1
0	0	1	0

particular we also convert 0 & 1 to 0 & 1 respectively

2	1	0	2	1
1	0	1	2	1
1	0	0	2	1

2	2	0	2	2
2	0	2	2	2
1	0	0	2	2

at  $t=2$  every orange  
is rotten

So  $ans = 2$

do multi source BFS

because rotting is happening  
level by level.

• Insert all 2's in a queue

(Q) We have  $n$  no's partitioned in  $S$  sets.

$(1, 3)$   $[5]$   $\{2\}$   $[4, 7, 9]$   $[8, 10, 6]$   
 $s_1$   $s_2$   $s_3$   $s_4$   $s_5$

Union  $(9, 3)$

$(1, 3, 4, 7, 9)$   $[5]$   $\{2\}$   $[8, 10, 6]$   
 $s_1$   $s_2$   $s_3$   $s_4$

So, perform Union  $(x, y)$ .

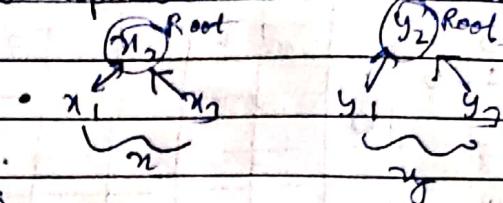

1) find set of  $x$

2) find set of  $y$

3) Merge.

Optimize union

Idea → we can have a representative element.

So now,

⑥ ① ② ③ ④ ⑤

own tree

Par 0 1 2 3 4 5

union  $(1, 0)$

union  $(4, 10)$

1) find  $4 \rightarrow s_1$

2) find  $10 \rightarrow s_4$

3) Unite  $s_1, 2, s_2, \dots, s_9$ , say  $s_2$

⑥ ① ② ③ ④ ⑤

Par 0 0 2 3 4 5

⑦ Par (root (1)) ← root (4)

or  
Par (root (4)) ← root (1)

• Smaller size tree will be merged with larger tree. This will be as balanced as possible.

• Every set is a connected component. So union op is adding edge to create a bigger connected comp.

How to find - keep finding

parent until  $\text{par}_i = i$

find  $\propto$  height

Union & find  $\propto$  height

union  $(1, 2)$

① ② ③ ④ ⑤ ⑥ ⑦ ⑧ ⑨

union  $(2, 4)$

① ② ③ ④ ⑤ ⑥ ⑦ ⑧ ⑨

union  $(4, 6)$

① ② ③ ④ ⑤ ⑥ ⑦ ⑧ ⑨  
 0 1 3 3 5 5 7 9

② ① ③ ④ ⑤  
 2 2 0 3 4 5

$s_{ij}$  3 1 1 1 1

union  $(x, y) \rightarrow O(n)$  → exp

find  $(x, y) \rightarrow O(1)$  → const

union  $(4, 1)$  find root (4)

find root (1)

④ ⑥ ① ③ ⑤ ⑦ ⑨  
 4 1 1 1 1 1 1

an optimisation

DSU → Disjoint Set Union

Solves Tough Problems  
Very Powerful DS,

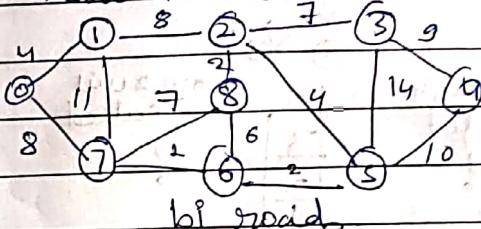

(Q) Given 'N' cities

N = 9

[0 ... 8]

Civil Eng

Plans to build roads -

build the roads in such a

way that all the cities can be

reachable from each other.

and construction cost is min-

Ob → NO cycles → useless

↳ means two paths

So the ans would be a

tree → no cycles and connected

Kruskal MST

• Sort the edges

• For edge (i)

if it does not form cycle include

it → ↳ use DSU

(Q) Given an undirected graph

Find whether there is a cycle

① DSU

7 → x

② DFS →

6

5

4

3

2

1

0

if in adj(x)

then 7 is a

y and y = Par(x)

↳ Vis(y) ← true

↳ cycle

conclusion → not a parent but

already visited →

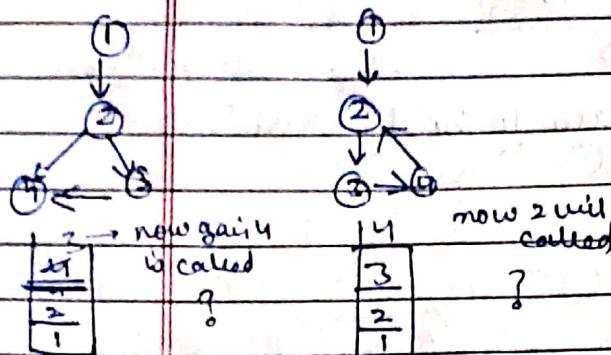

parent → who called the given node.

In case of directed graph:

↳ DSU will fail

Date \_\_\_\_\_  
Page \_\_\_\_\_

→ DSU fails if graph is directed

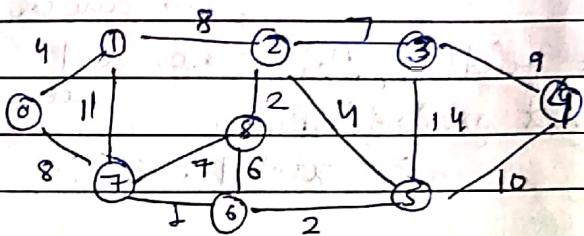

(3) Given a graph → undirected  
→ no self loop  
→ only positive weight  
given a node s.  
find distance of all nodes from s → (Single Source Shortest Path)  
or Dijkstra

back-edge → pointing towards

it's ancestor in DFS.

→ not  
flag → 1 → visited  
2 → process  
(in the stack).

backedge if flag is processing

flag[N] ← 0

dfs(0);

put dfs(0) into

{ if flag[i] ← 1. // start processing

for (j in adj[i])

{ if flag[j] = 1 → return 1

else if flag[j] = 0

dfs(j)

}

flag[i] = 2;

↗  
Backtrack

y.

do

Recur

undo

$$\text{dist} = [\infty \ \infty \ \infty \ \infty \ \infty \ \infty \ \infty \ \infty]$$

extract min → j ← 0. dist[0] = 0

$$[\infty \ \infty \ \infty \ \infty \ \infty \ \infty \ \infty \ \infty]$$

extract min → j ← 1. dist[1] = 4

$$[\infty \ * 12 (\infty \ \infty \ \infty \ \infty \ \infty)]$$

extract min → j ← 7 dist[7] ← 8

$$[\infty \ * 12 (\infty \ \infty \ \infty \ \infty \ \infty)]$$

extract min → j ← 7 dist[7] ← 8

if done using simple array O(V^2)

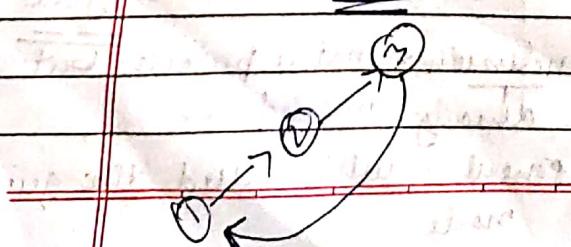

so painful part is extract min

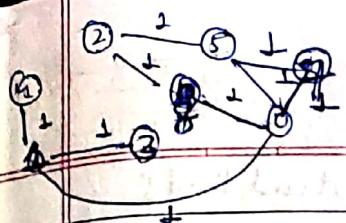

↳ use heap

Heap → have  
current distance

also maintain position array

so that you can update the  
distances in the heap

# LOW LEVEL DESIGN - I

## LLD - I

Date \_\_\_\_\_

Page \_\_\_\_\_

Till now → Procedural Paradigm

↓ now Objected Oriented →

• everything is object.

every Real World Entity.

class eagle extends Bird {

@override  
void fly() {

} } } } }

class Hen extends Bird {

@override  
void fly() {

} } } } }

(a) Design a Bird.

Object → Prototype  
Blue print  
(general bird)

Public class Bird {

double wt, ht, } attributes

String color;

void fly() } actions

More better??

Flap wings → both → so move to parent-

then call super fly()

(common part is move to parent)

e.g. Hen

Object → instance / snapshot

Bird hen = new Bird()

Bird eagle = new Bird()

hen.fly();

eagle.fly();

• Here same fly() fn can  
behave differently.

→ a naive way is to pass name of  
bird to fly fn.

"Problem - So many birds.

also code becomes dirty

So, How to restructure ??

use inheritance

Silent killer

↳ a new dev. didn't override

fly() → everything compiled  
but unexpected behavior.

Think of this bird as Template.

now implement each bird

Peacock implements Bird {

void fly() {

↳ the

↳ fn

are

} } } } }

↳ already

in

temp

void sleep() {

} } } } }

but now code Redundancy  
is brought back!

How to remove Redundancy()

so now create a class flying util

public class FlyingUtil

{ public void common()

{ Flap wings;

}

3.

void fly() {

common  
birds

FlyingUtil.common();

3

= bind specific

still code is not secure  
tampering with variables  
So use private access specifier

need getter, setter

is called as Encapsulation  
(Data Hiding)

• Redundancy ↘

• No silent kill

\* Not dirty

• Poly Morphism

what is Business logic in code?

the if else condition

in the code is termed as

Business logic → So data Hiding

becomes really difficult to make  
it run smoothly. It should not be  
handled.

interface Bird {  
 fly();  
 eat();

3

(Q) Given a codebase of 10,000 lines

class Peacock implements Bird {

How can you explain

it to a Tech / Non-Tech Guy

in 10 min??

Bird b = new Peacock();

Correct and called Runtime  
Polymorphism

comes handy → when  
handling all the birds.  
↳ generic

like if you want to sell

birds. class Seller {

void sell(Bird b)

can can can  
be be be  
peacock eagle albatross

① Sample I/p sample o/p

(So-100 feet view of system)

• UML Diagram → Unified Modelling Lang.

(i) Structural Explanation

② Behavioral Exp.

• Structural → relation b/w classes.

Interaction

• Behavior → what it does. (I/p → O/p)

~~structural~~ → use case → behavioral

use case → broader version of TC

↳ based on requirements

Example → library

- (1) Search Book
- (2) Issue book.

• it defines the boundary of a system  
↳ outside boundary will not be catered.

↳ Test cases would be

derived from use case

Search book → a string I/P

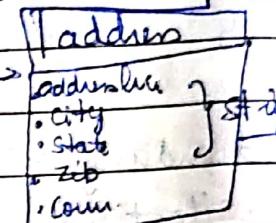

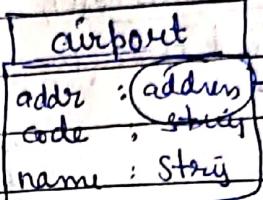

### Flight

- Flight no. → String
- dep. Airport → string
- arrival or → date
- duration

- book flight()
- cancel flight()

→ Actions

airport class → it will contain other information which will be encapsulated

### ① Use Case Diagrams

#### Online Shopping System

- search product → custom
- Add to cart
- Check Out • Payment

include → payment

checkout

search by user

Search Product

search by category

parent use case

reused with others

include → dependency

Payment will not be done until payment is done.

• Powerful structural → Class Diagrams

• Static Structure of your system.

↳ will not change frequently.

#### Flight Reservation System

Physical → Customer, Flight

### Flight

Flight No. → String

dep. : Airport

arriv. : Airport

duration, int

list < FlightInfo >

### Airport

name: String  
addr: Address  
code: String

Get instance → returns list of FlightInfo

different times

of same flight

Return

list of flight

now

last

depart

Associations

Many -to - Many

Dept Time

Date

Status

Flight <→ Airport

Departure Info

will change very

frequently

so they can be modelled  
by in different classes

## Flight instance

dept Time : Time

gate : string

status : string

cancel - bool

book - bool

4 PM - 6 PM → 10

AI 401 →

10 PM → 12 PM → 11

composition

List →

Multiple instances → same flight

Many to one Relation

- if flight crashes → what would happen to flight instances.

- a customer books a flight instance.

- Pilot, Crew, Passenger

Crew → Flight instance → Many - Many

Pilot → Flight instance. 2 → Many

bidirectional crew → getFlight

Pilot → getFlight

## ADMIN

- Add a Flight
- Add airport
- Add / remove Pilot

all are same

forms of

Person

all these will extend

Person → name

phone

email

id

## Flight Reservation

Res No : string

Flight inst : Flight Inst.

Seat Map : string

Status : Reservable Status

getPassengerId() → list of <person>

T

A

Gate

Date  
Page MINE

## LLD - 2

class Bird {

String col; int ht; int wt;

Public Bird (String color)

{ this.color = color;

Bird (b = new Bird ('Green'));

(Add 10 more attributes →

So you would do →

Bird b = new Bird (.....);

↳ very dirty.

↳ it's also backward incompatible

(bug) change is not uniform

along all previous version

↑ constructor overloading

still dirty → too many

constructors. →  $2^N$  combinations

How to solve??

① use of default values.

Static → uniform over all instances.

remains same over all instances.

② create a nested class. (static)

import this part in your code

overwrite over old file

1:58 AM

Public class Bird {

```
int ht, wt; string color;  
public Bird(Builder b)  
{ this.ht = b.ht;  
this.wt = b.wt; }
```

public static class Builder {

```
int ht, wt; string color;
```

```
public Builder() {};
```

```
public Bird ht(int ht)
```

```
{ this.ht = ht; return this; }
```

p

```
public Builder wt(int wt)
```

```
{ this.wt = wt; return this; }
```

```
public Bird build()
```

```
{ Bird b = new Bird(this);
```

```
return b;
```

convert builder to build -

}

Bird b = new Bird.Builder().

```
ht(5).wt(10).color('red');
```

```
build();
```

each dot is an instance of

builder class.

a new dev comes →

whenever → new Bird.Builder().

```
ht(5), Build();
```

will work fine -

cleaner code

(no issue of order mismatch)

now if int area comes, I will  
add this to class but other  
dev know or know not they will  
not face any issue.

Date \_\_\_\_\_  
Page \_\_\_\_\_  
How to stop interacting with  
the constructor, Bird → make it

private

← very popular design pattern.  
(Builder Pattern)

↳ instance How can we force client

of build to pass certain variables must?

class → change the Builder constructor

Public Bird (ht, wt)

```
{ this.ht = ht;  
this.wt = wt; }
```

Design Pattern → useful

• stateful class / stateless class

public class Adder

```
{ public static
```

```
int addC(int a, int b)
```

```
return a+b;
```

```
,
```

```
Adder.add(1,2)
```

public class Adder,

```
{ int a, int b;
```

```
Public C (int a, int b)
```

```
{ returning
```

```
,
```

```
},
```

```
Adder o = new Adder();
```

```
a.add()
```

↓  
stateless class

every class

will be same

two objects

will be different

because of different

State (different

new)

so, if the dev does

different variable make them

stateful → OOP. (you need to create obj)

stateless → procedural

Topics

## Industry Problem

→ Use Case

### ① Address Validation →

```
public class AddressValidator {
    zipvalidator z; StateValidator s;
    public boolean validate(Address a) {
        if (return z.validate(a.getZip()))
            22 c.validate(a.getCity())
            22 s.validate(a.getState())
        22 l.validate(a.getAddress());
    }
}
3. Validate each independently
then move to next level.
```

- For each validator you'll need to establish connection with DB.
- ↳ Each time you do this
  - ↳ too much time and poses a huge problem.

Maintain a ResourceInitilizer

- ↳ connects to a suitable DS.
- and then create 1 instance and share it.

```
public class ResourceInit {
    private static ResourceTest INST = null;
    private static Resource getInst() {
        if (INST == null)
            INST = new ResourceInit();
        return INST;
    }
    private ResourceInit() {
        if connect dB
            zips = read & parse zip
            cities = read & parse cities
    }
}
```

↳ now you have called the reqd. info. → now no need to connect everything

Date \_\_\_\_\_  
Page \_\_\_\_\_

public boolean checkIfValid(sty s)

{ ret zips.contains(sty); }

Now to call this

ResourceInit.getInstance().checkIfValid(sty).

• If true connection

established  
(everything cached)

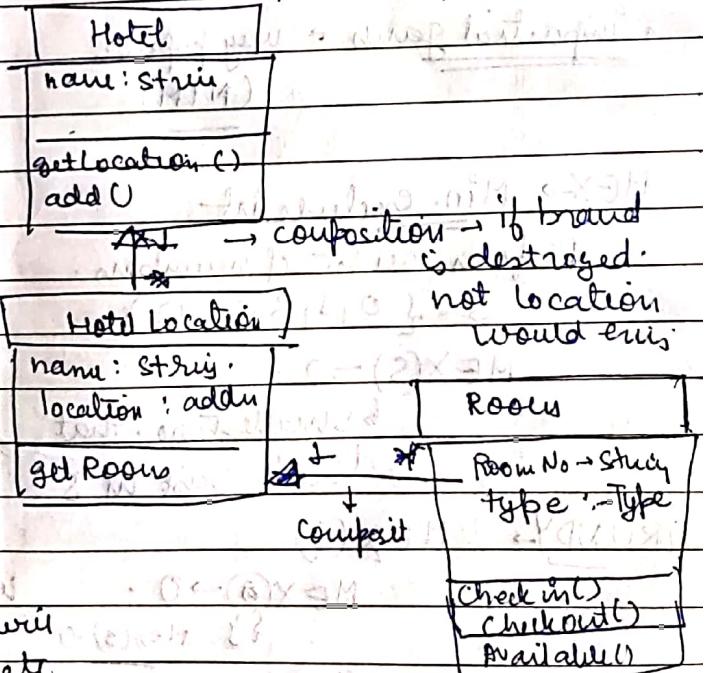

- Singleton Pattern → offers 1 instance
- ↳ Singleton → only 1 instance.
- ↳ imp → privatize the constructor
- ↳ C-like memorization

↳ If NULL → create else use the already

### (a) Hotel Management System

Imp → need to do

Objects → Hotel, staff, Room, Service, Address.

# GRUNDY NUMBERS

Date \_\_\_\_\_  
Page \_\_\_\_\_

if XOR (all set of position)

↳ 0 → losing

→ 1 → winning

(Q) Given 6 coin

Recursive -

Result(6) → XOR(g<sub>1</sub>(5), g<sub>1</sub>(4), g<sub>1</sub>(3))

XOR(1, 0, 3) → 2

winning

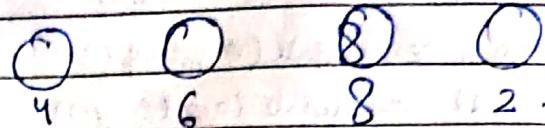

Res(5) → XOR(g<sub>1</sub>(4), g<sub>1</sub>(3), g<sub>1</sub>(2))

XOR(0, 3, 2) = 1  
winning

Res(4) → XOR(g<sub>1</sub>(3), g<sub>1</sub>(2), g<sub>1</sub>(1))

↳ XOR(3, 2, 1) → 0  
losing

Find the Grundy of base numbers, on itself.

$$F_{\text{floor}} = \{2, 3, 6\}$$

$$g(2) = \text{Men}(0, 0, 1) = 2$$

$$g(4) = \text{Men}(G(2), G(1), 4(6)) = \\ = \text{Men}(2, 1, 0) = 3.$$

$$g(6) = \text{Men}(3, 2, 1) = 0$$

$$\text{Men}(G(3), G(2), G(1)) = 0$$

$$= \frac{2}{2} \cdot \frac{2}{2} \cdot \frac{1}{1} = 0$$

$$g(3) = 2$$

$$g(3) = (G(1), G(1)) = \\ = (1, 1, 0)$$

$$g(8) = \text{Men}(G(4), G(2), G(1))$$

$$= \text{Men}(3, 2, 1) = 0$$

• impartial games = very popular  
(NIM)

So, XOR(2, 3, 0, 0)

MEX → Min. excluded

perform on set of numbers.

$$S = \{0, 1, 3, 8, 12\}, \dots$$

$$\text{MEX}(S) = 2$$

↳ smallest no. that  
doesn't exist in S

More would be to put

opp. in losing if k=1

even → D  
odd → A

GRUNDY → MEX(S)

$$\text{MEX}(0) \rightarrow 0.$$

$$\{ \} \quad \text{MEX}(0) \rightarrow 0$$

10 coins in a Pile -

$$\overline{\text{MEX}(1)} \rightarrow 1$$

1 ≤ coins to take ≤ 3.  $\text{MEX}(2) \rightarrow 2$

$$n=10$$

$$k=1 \rightarrow A \checkmark$$

$$k=1 \rightarrow A \checkmark$$

$$2 \rightarrow D \checkmark$$

$$3 \rightarrow A \checkmark$$

$$4 \rightarrow A \checkmark$$

$$4 \rightarrow D \checkmark$$

$$5 \rightarrow A \checkmark$$

$$6 \rightarrow D \checkmark$$

$$7 \rightarrow A \checkmark$$

$$8 \rightarrow D \checkmark$$

$$9 \rightarrow A \checkmark$$

$$10 \rightarrow A \checkmark$$

Grundy(10) = Grundy(

$$\text{Men}(g_1(9), g_1(8), g_1(7))$$

$$8 \rightarrow A$$

$$7 \rightarrow A$$

$$8 \rightarrow D \checkmark$$

$$9 \rightarrow D$$

$$9 \rightarrow A$$

$$10 \rightarrow A$$

$$10 \rightarrow A$$

## (Q) WORD Ladder

Find the min chain of transformation of words.

Idea → use BFS.

adjacent words would be those who differ by only 1 char or 0 char

Till now → • Builder Pattern → for bulky

• Singleton Pattern.

↳ when need to initialize once.

• in different countries → different forms of address → Eg. Japan → Prefecture

public class INValidator { → Indian

bool validate(Address a)

{

3. public class USValidator {  
    bool validate(Address a)

{

3.

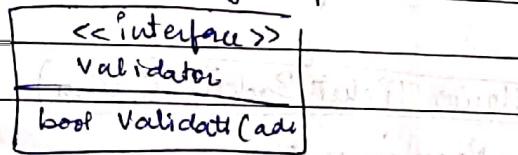

3.

public class ClientClass {  
    bool validateAddress(Address a)  
    { if (a.getCountry() == "US")  
        {return USValidator();}

i) leads to so many if else conditions → dirty.

ii) client must know the name of all the classes.

• since all are validators → then we can use Polyorphism.

• use a map on my side.

public class X {

private static Map<String, Val> c;

CountryVal.put("US", new USVal());

CountryVal.put("IN", new INVal());

public Validator getValidator(String c)

if (!countryVal.contains(c))

{ throw error "not supported" }

else return countryVal.get(c);

→ this constructor is doing intensive jobs → may be some class is connecting DB (so it must be initialized once).

it must be singleton class.

public static X getInstance()  
{ if (INST == null) INST = new X();  
return X; }

so the code will look like.

## X. getInstance(). get Validator() (argcount). validate(a).

↳ must use try catch because there can be exception.

- Factory Pattern ↗  
↳ provides different

factory → first gives the name.

- Singleton Factory Pattern:

when to implement this?

## Movie Ticket Booking System

- Requirements

- Physical objects • use cases

### Use Cases

\* - List all the centers PVR, etc.

\* Each cinema center ↗ screens

Movie → Multiple shows.

At  $t=t_0$  → 1 show per movie hall.

\* Search → movie by theater, movie by date.

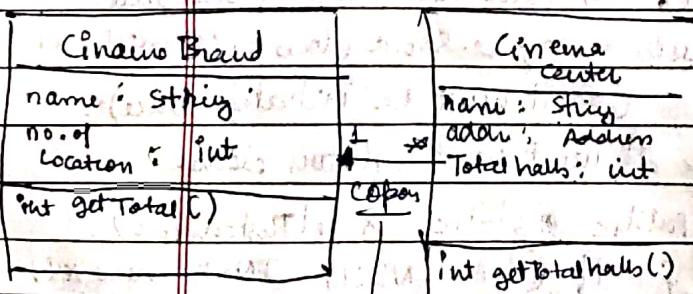

\* Seating arrangement

↳ List of reserved and vacant

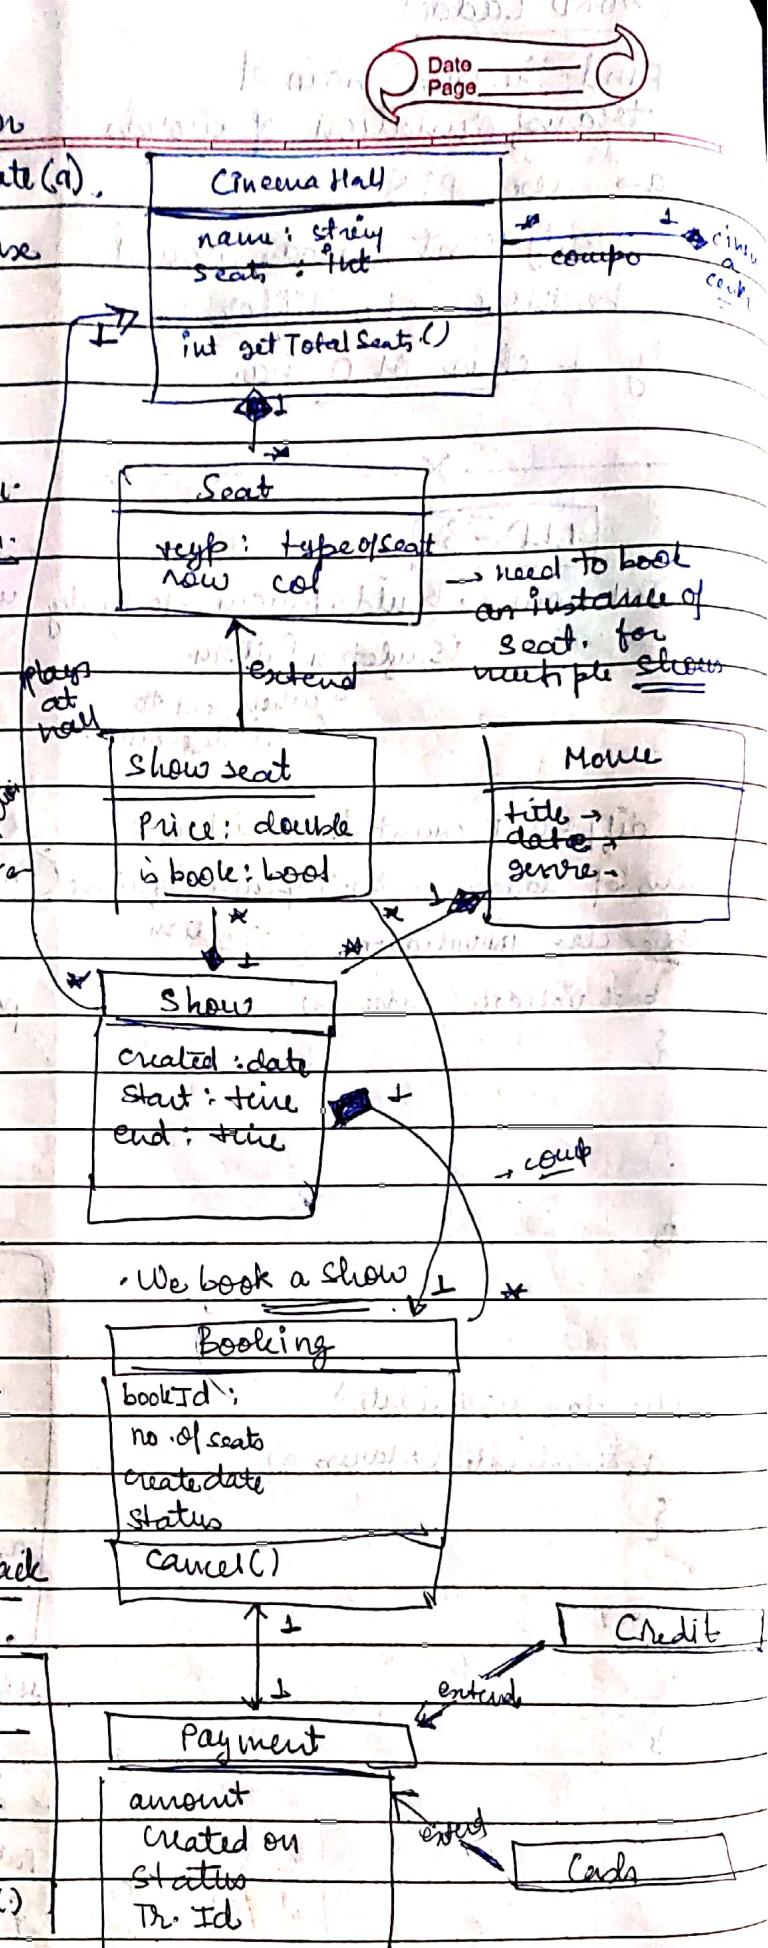

\* Notifications

↳ Payment → Card, Cash etc.

\* discount coupon + cashback

Composition  
if brand dies  
no center  
will end.

- If horses doesn't return in a threshold resending for the food of that day.

- If few boxes were missing How to know → Maintain a checklist.

↳ lead to TCP protocol

### Q1 Structure of data packet

- bunch of packets → Sequence No. will solve.
- auto/ordered → may reach (may not).

### • UDP protocol

- ↳ no guarantee
- ↳ no acknowledgement
- ↳ whether reaches on time or not
- ↳ very light weight.

### • Media streaming → UDP

- ↳ to transmit video
- ↳ if some data missed → let it be and move forward.

### # Working of TCP

- ① Establishes connection (3 way handshake)

- ① Ask
- ② get Reply
- ③ ACK sending → starts here.

- ② Send packets → Seq. No. each has → check sequence. wait for ACK if not in time → resend ACK is sent only if the packet is correct.

### Checksum

a very naive way.

checksum = 16 bits

and then check if 16 bits are 16. → but very inaccurate

check login

\$ test name

## COMPUTER NETWORKS

- Network → Machines connected in some sort of fashion in order to communicate.

How would they talk??

A protocol is defined which is abided by both parties.

(a) Army 1

Army 2

Send

Food1

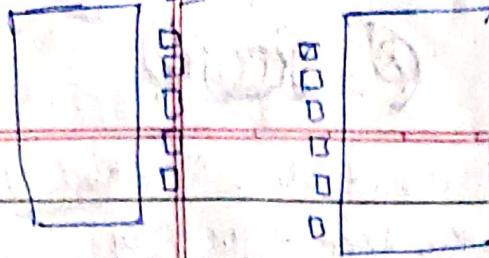

Food2

Food n

How?

We → send one by one and get acknowledgement.

Socket → IP + port

What happens when you type google.com

① DNS lookup → return IP

② go to that IP (TCP connection established).

ICANN → maintains legitimate info

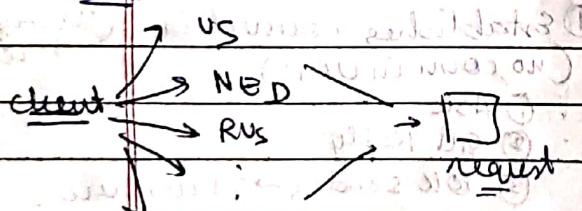

Browser DNS Cache → expires 1 day.

→ no dns lookup if triggered again.

what was 2G, 3G Scams?

Allocating a certain amount of frequency.

\* TOR Browsers

Slow because you are having multiple hops.

### Bandwidth

• shared

• leased → only to 1 person  
Shared among many.

• leased → only to 1 person

Shared among many.

- ping google.com. on terminal.  
→ starts sending seq packets to req site and make the stats.

• dig google.com.

• all internal connection (LAN)

IP → WAN

IP → LAN

• HUB vs switch vs Router.

• HUB → broadcast to everyone that is there in it.

• Switch → Multicasts the message (list of IP's). Smart HUB.

• Routing → similar to switch

but connects to IP's across networks.

• Gateway → local network to outside boundary

Say N<sub>1</sub> of Google Routers which

wants to talk to Yahoo, it has to pass from Gateway.

### # Routing Algo

① Fixed Routing

→ centralised

→ distributed

② Adaptive Routing

→ smart

③ Flooding (Doesn't care)

→ random behaviour

① F) X

- Done dijkstra at the beginning and it never changes.

~~Geo~~ So if some nodes dies then no path exists.

Distributed Fixed Routing

- each Router stores its next Router to go to.

② Adaptive

- depends on state of the network
  - Recompute the tables.
- Network IP = (IP & Subnet Mask)

Subnet Mask:

$$24 \rightarrow 255.255.255.0 \rightarrow \underbrace{\quad\quad\quad}_{8\ 8\ 8} \text{ CIDR}$$

- Classless and Classful IP
- size fixed
- are decided by production
- close hosts

③ Flooding

- R<sub>i</sub> sends to all its neighbours and then so on.
- to avoid cycles → hop count
- hop → each Router has hop count
- at ~~now~~ and when it reaches 0 → packet dropped.

always gets you shortest  
but more stress on Routers.

- inside a network (LAN) internal nodes can talk to each other either by ~~IP~~ IP protocol or MAC.

# IP Addresses

IPv4

0-255. 0-255. 0-255. 0-255.

0-255

8 bits after each.

32 bits

total  $2^{32}$  bits

Run out of IPv4 addresses

Slowly moving to IPv6.

Fist no. of IP

Class A : 1-126

Class B : 128-191

Class C : 192-223

Class D : 224-239

↳ First 8 bits → depends  
on 8 bits

127 → localhost or loopback.

IP addresses → Network ID

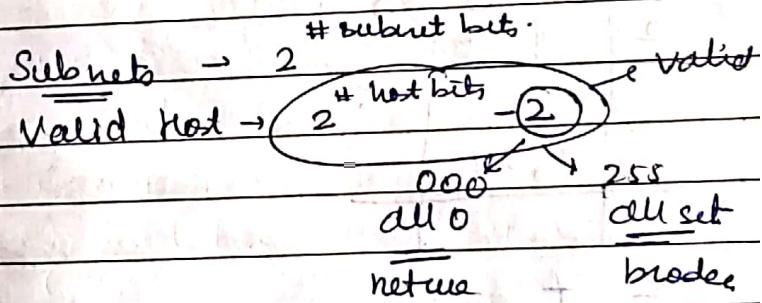

→ Subnet Mask.

IP: (192.168.32.128) / (0-32)

L denotes set bits of IP

Subnet Mask:

$$24 \rightarrow 255.255.255.0 \rightarrow \underbrace{\quad\quad\quad}_{8\ 8\ 8} \text{ CIDR}$$

150.150.0.0 / 30

→ 30 set bits

Find the class → A, B, C.

then remaining 1's will be subnet bits and 0's would be host.

Places to change.

Codeforces

Q → Roads not only in Berland

Spoj → Colorful Army

RQ → Range queries to color the cells.

Find the color of each cell after end of queries.

## Operating System - I

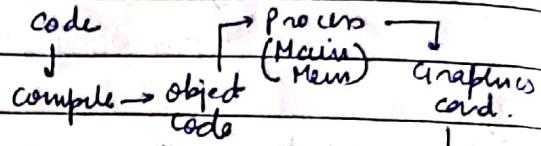

App

OS

Device

Devices to talk  
to apps need

an OS in b/w  
(Middle layer)  
comp.

- Abstracts the hardware  
no need for us to configure  
the device.

- It does Resource Mgmt.

# Processor  
power to run and execute  
instructions. compared by  
clock speed.

5 GHz → 5 × 10<sup>9</sup> instruction  
per sec.

RAM >> HD.

↓  
capacitor  
Transistor

Magnetic  
Disk

Cache >>

100 kB-SMB

↑ used with cache

• SRAM → Static → Transistor

DRAM → Dynamic → capacitors

↓ used in RAM. leak current  
and are slow.

• Multi-Programming

if a process waits for I/O  
processor does a context switch  
to a new process.

How does processor know?

status changes from  
I/P to Ready.

## Multi - Processing

Same scenario as before but now a new processor.

So, Multiprogramming + Process (Multi)

## MultiTasking

You are processing 1 process at a single unit of time but when you look it over a span of time You'll find a bunch of process giving a view of simultaneous execution of processes. → This is Multitasking

(Time Slicing takes place)

all these require Job Scheduling

(A)

(B)

Print A-Z Print 1-100

So in Multitasking → Since Time is sliced O/P → ABC 123 DEF GHI JKL

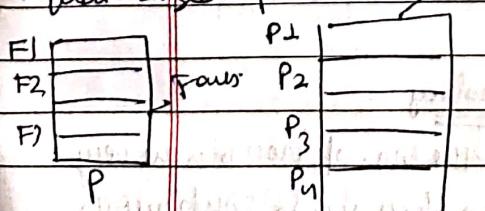

- Process is always run in RAM
- Programs reside in HD.

## Fragmentation

You have available space but not contiguous amount of space → Ram is split into fragments of free memory.

How to solve?

Divide the process into equal sized frames, Pgs

Frame Size = Page Size

So now we can assign frames non-contiguously.

To keep track of frames and page we have -

## Processor Page Table

# Frame	# Page	→ No Process each Process will have its own Process Table

All this task is done by Kernel (OS in Admin Mode) (Creating Frames assigning Pages etc)

# Windows is susceptible to viruses

because it's a private OS and has to wait for their own dev to fix and release security updates.

However Linux is open source.

So whenever a virus comes the dev automatically patches them.

So in general viruses are created for windows so that they would pay them to get the virus removed.

. no need to load all the frames at once. You can load some subset into RAM.

## Virtual Mem & Demand Paging

When is demand paging used →

- Either your process is too big to fit inside the RAM

or

- There are only few pages that can accommodate some of the frames. → leads to demand Pg
